Sphinx Builder 2

`rinoh.frontend.sphinx` is a Sphinx extension module. It provides a Sphinx builder with the name *rinoh*. The builder recognizes the following `conf.py` options. Of these, only `rinoh_documents` (or `latex_documents`) is required.

`rinoh_documents`
Determines which PDF documents to build. Its format is a list of dictionaries, one for each document to be generated. The supported keys for these dictionaries are listed below. Two of them are required:

doc (required)
String that specifies the name of the master document (typically `index`).

target (required)
The name of the target PDF file without the extension.

The following keys allow overriding the content included on the document's title page and page headers/footers (depending on the template and its configuration). The values for text content can be plain text or `StyledText`.

logo (no default)
Path (absolute or relative to the location of the `conf.py` file) to an image file, typically included on the title page.

title (default: "`project` documentation")
The title of the document.

subtitle (default: "Release `release`")
Subtitle of the document.

author (default: "`author`")
The document's author.

date (default: determined from `today` and `today_fmt`)
The document (build) date.

The remaining keys control what is included in the document and the document template (configuration) to use.

toctree_only (default: `False`)
Must be `True` or `False`. If true, the document itself is not included in the output, only the documents referenced by it via TOC trees.

domain_indices (default: `True`)
If true, generate domain-specific indices in addition to the general index. It is equivalent to the `html_domain_indices` and `latex_domain_indices` configuration variables.

template (default: `Book`)
Determines the template used to render the document. It takes:

- the filename of a template configuration file,
- a `TemplateConfiguration` instance,

- the name of an installed template (see `rinoh --list-templates`), or
- a `DocumentTemplate` subclass

rinoh_documents will also accept other keys than those listed above. These items will be available as document metadata and can be used in a custom document template.
Example:

```
rinoh_documents = [
    dict(doc='index', target='manual', toctree_only=False,
         template='manual.rtt', logo='logo.pdf'),
    dict(doc='ref', target='reference', title='Reference Manual',
         template='reference.rtt', stamp='DRAFT'),
]
```

rinoh_targets

Limits rendering to the specified set of targets. This variable accepts either a list of strings or a string containing comma-separated values. The target names should match those set in `rinoh_documents`.
To render only the 'manual' target, you can set the following in `conf.py`:

```
rinoh_targets = ['manual']
```

The same can be achieved from the command line using the by using the string form with `sphinx-build -D`:

```
spinx-build -b rinoh -D rinoh_targets="manual" source build
```

2.1 Legacy Configuration Variables

The configuration variables below are no longer supported. Instead, their functionality can now be configured per document in `rinoh_documents`.

rinoh_template

This configuration variable is **no longer supported** since the document template can be specified in `rinoh_documents` entries.

rinoh_stylesheet

This configuration variable is **no longer supported** since it is not obvious which style sheet will be used when the template configuration also specifies a style sheet. Please specify the style sheet to use in your template configuration file:

```
[TEMPLATE_CONFIGURATION]
name = My Book
template = book
stylesheet = my_stylesheet.rts
```

rinoh_paper_size

This configuration variable is **no longer supported** since it was not obvious which paper size was being used when the template configuration (`rinoh_template`) also specified a paper size. Please specify the paper_size to use in your template configuration file:

```
[TEMPLATE_CONFIGURATION]
name = My Book
template = book

[VARIABLES]
```

```
paper_size = A5
```

rinoh_logo
: This configuration variable is **no longer supported** since the logo can be specified in the `rinoh_documents` entries.

rinoh_domain_indices
: This configuration variable is **no longer supported** since the domain_indices can be specified in the `rinoh_documents` entries.

rinoh_metadata
: This configuration variable is **no longer supported**. Metadata entries can now be added to `rinoh_documents` entries.

Style Sheets 3

3.1 Included Style Sheets

These style sheets are included with rinohtype:

`rinoh.stylesheets.`**`sphinx`**
: Mostly a copy of the LaTeX style included with Sphinx
Entry point name: `sphinx`

`rinoh.stylesheets.`**`sphinx_article`**
: The Sphinx stylesheet adjusted for the article template
Entry point name: `sphinx_article`

`rinoh.stylesheets.`**`sphinx_base14`**
: The Sphinx stylesheet, but using the fonts from the PDF core set (yielding smaller PDF files)
Entry point name: `sphinx_base14`

Additional style sheets can be installed from PyPI. The installed style sheets can be listed using `rinoh --list-stylesheets`.

3.2 Default Matcher

The default matcher provides the selectors for the styles used in the standard style sheets.

`rinoh.stylesheets.`**`matcher`**

```

Fractional dimensions are evaluated within the context they are defined in. For example, the width of a `Flowable` is evaluated with respect to the total width available to it.

If this flowable's *float* style attribute is set to `True`, it is not flowed in line with the surrounding flowables, but it is instead flowed into another container pointed to by the former's `Container.float_space` attribute.

This is typically used to place figures and tables at the top or bottom of a page, instead of in between paragraphs.

style_class
alias of `FloatStyle`

flow (*container*, *last_descender*, *state=None*, ***kwargs*)
Flow this flowable into *container* and return the vertical space consumed.
